

Assignment #2

You will rewrite assignment #1, but use functions to enable code re-use.

You will write the following:

- a `main()` function containing your main programming.
- a `printRectangle()` function which will take a height and width (floats) as parameters. It will print the statement:
- rectangle with height: 3.55 and a width of 2.544 has an area of: 9.031 and a perimeter of: 12.188. (but using the parameter data sent to the function).
- a `uiRectangle()` function which will ask the user (input) for a height and width (float) and call the `printRectangle` function above to print the results.
